TACEDGE

Shared Clarity.

For ground-engineering delivery.

THE PROBLEM

Field data becomes project overhead.

- Field records arrive fragmented, or go missing.
- Project managers spend hours entering and reconciling data into reports.
- Engineers receive delayed, reconstructed reports that are hard to verify.

THE POINT

Project managers should assure the work, not assemble the report.

THE WORKFLOW · CONFIGURE. CAPTURE. CONFIRM.

Configured → **Captured** → **Confirmed**

One work item. One connected record, from setup to release.

QUESTIONS WE'D LIKE TO EXPLORE

- Where is the friction in capture, QA and reporting today?
- What would crews and PMs actually use at the workface?
- Is one workflow worth validating together on live work?
